**ABSTRACT.** Let  $M$  be a module over a commutative ring  $R$ . The annihilating-submodule graph of  $M$ , denoted by  $AG(M)$ , is a simple undirected graph in which a non-zero submodule  $N$  of  $M$  is a vertex if and only if there exists a non-zero proper submodule  $K$  of  $M$  such that  $NK = (0)$ , where  $NK$ , the product of  $N$  and  $K$ , is denoted by  $(N : M)(K : M)M$  and two distinct vertices  $N$  and  $K$  are adjacent if and only if  $NK = (0)$ . This graph is a submodule version of the annihilating-ideal graph and under some conditions, is isomorphic with an induced subgraph of the Zariski topology-graph  $G(\tau_T)$  which was introduced in [H. Ansari-Toroghy and S. Habibi, Comm. Algebra, 42(2014), 3283-3296]. In this paper, we study the domination number of  $AG(M)$  and some connections between the graph-theoretic properties of  $AG(M)$  and algebraic properties of module  $M$ .
